Fred Hoyle's 1957 novel The Black Cloud was the first novel by the renowned, perhaps now forgotten (because his big ideas turned out to be wrong), astronomer of the mid-20 th century. It's still his most famous, and likely best, novel, out of some nearly 20 novels he would subsequently write, some in collaboration.

"One of the greatest works of science fiction ever written." - Richard Dawkins "Without a question the most intelligently written science fiction story I have ever read . . . A terrific yarn." - "Charlotte Observer" "An eerie story which demands the reader's attention from start to finish." - "Denver Post" "[A] rattling good story . . . a really thrilling book. There is a largeness, generosity, and jollity about the whole spirit of the book that reminds one of the early Wells at his best." - G. S. Fraser, "New Statesman" Astronomers in England and America have made a terrifying discovery: an ominous black cloud the size of Jupiter is travelling straight towards our solar system. If their calculations are correct, the cloud's path will bring it between the Earth and the Sun, blocking out the Sun's rays and threatening unimaginable consequences for our planet. With the fate of every living thing on Earth in the balance, world leaders assemble a team of brilliant scientists to figure out a way to stop the cloud. But when they uncover the truth behind its origins, they will be forced to reconsider everything they think they know about the nature of life in the universe . . . A landmark of British science fiction, "The Black Cloud" (1957) was the first novel by world-renowned astronomer Sir Fred Hoyle (1915-2001), who used his own scientific background to create a frighteningly real apocalyptic thriller in which, Hoyle said, "there is very little that could not conceivably happen." Long recognized as a classic in Great Britain, Hoyle's novel returns to print in the U.S. for the first time in over 40 years in this edition, published to coincide with the centennial of the author's birth and featuring a new foreword by Geoffrey Hoyle.

A 1959 classic 'hard' science-fiction novel by renowned Cambridge astronomer and cosmologist Fred Hoyle. Tracks the progress of a giant black cloud that comes towards Earth and sits in front of the sun, causing widespread panic and death. A select group of scientists and astronomers - including the dignified Astronomer Royal, the pipe smoking Dr Marlowe and the maverick, eccentric Professor Kingsly - engage in a mad race to understand and communicate with the cloud, battling against trigger happy politicians. In the pacy, engaging style of John Wyndham and John Christopher, with plenty of hard science thrown in to add to the chillingly credible premise (he manages to foretell Artificial Intelligence, Optical Character Recognition and Text-to-Speech converters), Hoyle carries you breathlessly through to its thrilling end.

A huge black cloud heading for the Earth will block the sun and wipe out life on Earth. Scientists assemble to stop the cloud, but are forced to rethink humankind's place in the universe.

A new radio telescope picks up a complex series of signals from the Andromeda constellation -- signals which prove to be a programme for a giant computer. When the computer begins to relay the information it receives from Andromeda, the project assumes a vital importance, for scientists find themselves possessing a knowledge previously unknown to man -- knowledge of such a nature that the security of human life itself is threatened.

In Home Is Where the Wind Blows, Sir Fred Hoyle, one of this century's most eminent scientists and author of dozens of successful books, both fiction and nonfiction, offers a revealing and charming account of his life and work. Mathematician, physicist, astronomer, cosmologist - Sir Fred is perhaps best known, in scientific circles, for his brilliant explanation of the origin of the elements from hydrogen nuclei in stars (a process known as nucleosynthesis) and for developing (with Sir Hermann Bondi and Thomas Gold) the elegant but controversial steady-state theory of the Universe (which assumes the continuous creation of matter). In 1950, in the last of a series of radio lectures on astronomy that he delivered on the air for the BBC, Sir Fred coined the term "Big Bang" to characterize the competing expanding-Universe theory, which has since become the dominant paradigm. Ironically, the term has become a permanent addition to the language of cosmology. Sir Fred's name has become well known to the general public because of his unusual ability to describe the ideas of science in a simple and accessible way. In addition to his scientific work, he has written more than a dozen works of popular science (many of them widely translated) and more than a dozen works of science fiction (most of them in collaboration with his son, Geoffrey). In all his work, Sir Fred has shown himself to be ready and able to challenge established thinking. In the author's amusing and memorable account of his childhood in Home Is Where the Wind Blows, the reader will see how this came to be true. Possessed since infancy with a strong streak of independence, he was encouraged by his parents, throughout his school years, to trust his own judgment and to think for himself.
