Numerical methods for ordinary differential equations are methods used to find numerical approximations to the solutions of ordinary differential equations.

Their use is also known

Solution: The first and second characteristic polynomials of the method are  $\rho(z) = z^2 - 1$  ,  $\sigma(z) = 1 - 2(z+3)$  .

Therefore the stability polynomial is  $\rho(r; \tau h) = \rho(r) - \tau h \sigma(r) = r^2 - 1 - 2\tau h r + 6\tau h$  . Now,

**INTRODUCTION** • A number of numerical methods are available for the solution of first order differential equation of form: •  $\frac{dy}{dx} = f(x, y)$  • These methods yield solution either as power series or in x form which the values of y can be found by direct substitution, or a set of values of x and y.

If the derivatives are obtained by differencing the numerical solution of the differential equations, the smoothness of that solution with respect to parameter changes is crucial to the performance of minimization codes. This
