NAL launches its new SF imprint, ROC, with a collection of 18 of Asimov's (Foundation) robot stories. The earliest tales here, written from 1940 to 1960, remain among the most-loved in the field, the best being "Little Lost Robot," about a robot who obeys an order to "get lost." "The Bicentennial Man" (1976) about one robot's desires and efforts to be first free, then equal, is the quintessential robot-as-man's-mirror story. The book concludes with brief essays offering companionable commentary on the history of robots in fiction, the Frankenstein complex, the origin of Asimov's famous Three Laws and the author's own surprise at the emergence of robots during his lifetime. Is it possible to design robots and other machines that can reproduce and evolve? And, if so, what are the implications: for the machines, for ourselves, for our environment, and for the future of life on Earth and elsewhere? In this book the authors provide a chronological survey and comprehensive archive of the early history of thought about machine self-reproduction and evolution. They discuss contributions from philosophy, science fiction, science and engineering, and uncover many examples that have never been discussed in the Artificial Intelligence and Artificial Life literature before now. In the final chapter they provide a synthesis of the concepts discussed, offer their views on the field's future directions, and call for a broad community discussion about the significant implications of intelligent evolving machines. The book will be of interest to general readers, and a valuable resource for researchers, practitioners, and
